

Module -2

1) What is List? How will you reverse a list?

Ans.:- A list is a data structure in python that is a mutable, or changeable, ordered sequence of elements.

Reverse method in Python is a built-in method that reverses the list in place.

2) How will you remove last object from a list?

Ans.:- The method pop() can be used to remove and return the last value from the list or the given index value.

→ Suppose list1 is [2, 33, 222, 14, and 25], what is list1 [-1]?

Ans.:- list is 25
